Chester, Vermont (PRWeb) February 8, 2007 -- Specific strategies and tools are now available that minimize the potential for human error when implementing Six Sigma processes. Following years of testing and refinement, these strategies and tools are now being made available by the [Practicing Perfection Institute, Inc \(PPI\)](#).

"We've taken the best human error prevention tools and strategies developed over the past 15 years within the US Commercial Nuclear Power and Commercial Airline industries," stated Tim Autrey, CEO of the Practicing Perfection Institute, Inc., "and made them directly available for specific use during all phases of Six Sigma processes within all industries."

The specific strategies/tools and how to apply them to Six Sigma processes are detailed in a Special Report released today by PPI. Entitled, "Mistake-Proofing Six Sigma: How to Narrow Project Scope and Minimize Human Error," the report makes clear how to eliminate the ambiguity (or 'fuzziness') involved in the human side of the equation, and put specific mechanisms in place to greatly reduce the potential for human error.

"In my business I'm always looking to reduce variability in processes, but we always have to deal with the people element and the variation that comes with that," states Hank Berry, Six Sigma Master Blackbelt. "These concepts of human performance and error elimination have helped us tremendously in dealing with, and in some cases eliminating, the variation that comes with having people performing the major roles in our processes."

Use of these strategies and tools can help narrow the scope of a project on the front end, make for more comprehensive analysis and measurement, and offer specific elements for use during implementation and control that greatly reduce the potential for people to make mistakes.

"Since the essence of Six Sigma is to use every appropriate tool to 'improve improvement'," continues Autrey, "these strategies and tools are excellent additions to the process whenever humans are involved."

About PPI:

The Practicing Perfection Institute, Inc. was founded in 2005 with a profound vision: Error-free, world-wide- one life at a time. It is pursuing this vision by providing education, resources, and consulting services relative to the reduction and elimination of human error. With a mission to save lives, keep people from getting hurt, prevent catastrophe, and enhance organizational efficiency, the Institute is rapidly becoming a central community for error reduction professionals worldwide.
